

InnovateHub : Innovation Idea Portal

SOFTWARE INSTALLATION REQUEST AUTOMATION IN SERVICENOW

1. INTRODUCTION

InnovateHub is a ServiceNow-based innovation management application that provides a centralized platform for employees to submit creative ideas, reviewers to evaluate them, and managers to make final approval decisions. The system replaces manual processes such as email communication and spreadsheets with a structured digital workflow. Using ServiceNow tables, forms, ACLs, client scripts, Flow Designer, notifications, reports, and dashboards, the application improves transparency, collaboration, and efficiency. Employees can track the progress of their ideas throughout the complete lifecycle, ensuring every submission is reviewed systematically.

1.1 Project Overview

The application consists of three primary roles: End User, Reviewer, and Manager. End Users submit ideas with complete details, Reviewers assess feasibility and provide comments, and Managers make the final approval decision. Role-based access control ensures that each user edits only their assigned section, improving security and data integrity.

1.2 Purpose

The main objective of InnovateHub is to encourage innovation within an organization by simplifying idea submission and approval. The project reduces manual effort, eliminates communication gaps, improves decision making, and maintains complete visibility of every innovation request.

2. IDEATION PHASE

The project started by studying common problems faced by organizations while collecting and evaluating employee ideas. Brainstorming sessions identified opportunities to automate idea submission, review workflows, approval processes, notifications, and reporting.

2.1 Problem Statement

Many organizations rely on emails and spreadsheets to collect employee ideas. This leads to delayed reviews, lack of ownership, duplicate submissions, and poor visibility. Employees often do not know the status of their ideas, while managers cannot easily monitor pending approvals.

2.2 Empathy Map

Employees expect a simple and transparent process for submitting ideas. Reviewers require complete information to evaluate submissions effectively, while managers need accurate

review data to make informed approval decisions. The system addresses these expectations through automation and role-based workflows.

2.3 Brainstorming

Several ideas were explored, including digital forms, automatic reviewer assignment, approval workflows, email notifications, dashboards, analytics, and secure role-based access. The final solution combined these features into a single ServiceNow application.

3. REQUIREMENT ANALYSIS

Functional requirements include idea creation, reviewer evaluation, manager approval, notifications, reports, dashboards, and status tracking. Non-functional requirements include security, usability, scalability, reliability, maintainability, and performance.

3.1 Customer Journey Map

The customer journey begins with idea submission, followed by reviewer evaluation, manager approval, and final status notification. At every stage, users can view relevant information according to their role.

3.2 Solution Requirement

The solution uses custom ServiceNow tables, forms, client scripts, UI policies, ACLs, Flow Designer automation, notifications, reports, dashboards, and role-based security to automate the innovation lifecycle.

3.3 Data Flow Diagram

Employee input is validated through the form and stored in the Innovation Idea table. Review information is added by reviewers, manager decisions are recorded, and the final status is updated automatically for reporting and tracking.

3.4 Technology Stack

Platform: ServiceNow

Frontend: ServiceNow Forms & Workspace

Backend: ServiceNow Server-side Logic

Database: ServiceNow Custom Tables

Automation: Flow Designer

Security: ACLs, Roles, Client Scripts, UI Policies

Reporting: Reports & Dashboards

4. PROJECT DESIGN

The application follows a layered architecture with presentation, business logic, security, database, and reporting layers. Every layer works together to ensure secure and efficient processing.

4.1 Proposed Solution

The proposed solution provides a centralized innovation portal where employees submit ideas, reviewers evaluate them, managers approve or reject them, and users receive complete status visibility.

4.2 Solution Architecture

End User → Innovation Form → Innovation Table → Reviewer → Manager → Final Status → Reports & Dashboard.

5. PROJECT PLANNING & SCHEDULING

The project was developed using Agile methodology in multiple iterations. Sprint planning divided work into manageable tasks such as table creation, role configuration, ACL implementation, client scripting, testing, and documentation.

5.1 Sprint Planning

Sprint 1 focused on database tables, forms, roles, and security. Sprint 2 focused on workflow automation, testing, reports, dashboards, and documentation.

5.2 Testing Strategy

Unit testing, functional testing, integration testing, and user acceptance testing were performed to validate idea submission, reviewer access, manager approval, notifications, and role-based security.

6. FUNCTIONAL & PERFORMANCE TESTING

Different test cases confirmed that every module functioned correctly. Performance testing ensured that records were processed efficiently without affecting usability.

7. RESULTS

InnovateHub successfully automated the innovation process, improved collaboration, reduced manual work, increased transparency, and ensured secure role-based access for all users.

8. ADVANTAGES

- Centralized idea repository
- Automated review and approval
- Role-based security
- Better tracking
- Faster decision making
- Reduced paperwork
- Improved collaboration

9. CONCLUSION

InnovateHub demonstrates how ServiceNow can simplify innovation management through automation, security, and transparency. The application encourages employee participation while reducing administrative effort.

10. FUTURE SCOPE

Future enhancements include AI-based idea recommendations, predictive analytics, email integration, Microsoft Teams integration, mobile application support, KPI dashboards, and intelligent reviewer assignment.
